

Genoderm

COMPOSITION

Each tablet contains:

Cyproterone Acetate 2.00 mg. + Ethinyl Estradiol 0.035 mg.

DRUG ACTION

Cyproterone Acetate present in GENODERM is a competitive androgen blocker (anti-androgenic effect).

In addition to this effect, Cyproterone Acetate also has a progestational activity.

Ethinyl Estradiol in this formula inhibits ovulation, alters the cervical mucus and the endometrium, and thus creates unfavorable conditions for the penetration of sperm and the implantation of the fertilized egg, respectively.

INDICATIONS

GENODERM is indicated for the treatment of androgen-dependent acne, especially if it occurs together with seborrhea, due to inflammation or formation of nodules (papulopustular acne or nodulocystic acne), androgenic alopecia, and mild forms of hirsutism.

GENODERM is the oral contraceptive of choice in women requiring anti-androgenic therapy.

It is therefore considered a therapeutic contraceptive.

DOSAGE

Take one GENODERM tablet on a daily basis for 21 days. After a 7-day rest period, on the 8th day continue with a new package.

Start the treatment with GENODERM on the first day of the cycle (first day of menstrual bleeding).

PRESENTATION

Each package contains 21 tablets.
